

Reggie Alleyne Portfolio Style Guide

A reusable design system and guide extracted from the live portfolio. It documents the current color tokens, Poppins type scale, spacing rhythm, lucide icon usage, liquid-glass controls, proof notes, project cards, motion rules, and route references.

COLOR

Restrained violet with teal proof signals.

Violet is used for primary actions, active states, focus, and selected brand moments. Teal is reserved for proof, evidence, and reviewer confidence. Neutral surfaces stay lightly tinted, which keeps the interface bright without becoming flat.

TYPOGRAPHY

Poppins carries both proof and personality.

The system uses a single family with committed weight and scale contrast. Display type is reserved for page-level statements. Cards and compact panels use tighter headings.

DISPLAY SAMPLE

Product decisions behind the interface.

SPACING AND MATERIALS

Soft structure with selective glass.

Most surfaces should stay flat or lightly raised. The liquid material is strongest when saved for navigation, overlays, and controls that need top-layer presence.

Liquid glass

Top-layer controls, proof chips, hover affordances.

Dark nav glass

Floating navigation and dark bento surfaces.

Flat archive surface

Most project cards, evidence notes, and case-study sections.

NAVIGATION AND ICONS

Icon-first controls with labels when active.

The portfolio uses lucide-react icons such as Home, BriefcaseBusiness, Sparkles, UserRound, MessageCircle, ArrowUpRight, FileCheck2, and Code. Icons support commands and status. They should not become decorative badges above every heading.

COMPONENTS

Project cards and proof notes are the core pattern.

The component system exists to answer one question quickly: is there enough proof to trust the work? Keep decision, evidence, role, year, and link behavior close together.

Staybooked – AI Airbnb Optimizer

A room and listing optimizer for short-term rental hosts who need better photos, sharper copy, and clearer booking signals.

Role	Timeline	Year	Team
UX/UI Designer & Frontend Developer	Product sprint	2026	1

FAST CONTEXT

Reviewer snapshot

Role, product judgment, evidence, and artifacts in one compact scan.

ROLE

UX/UI Designer and Frontend Developer

PROBLEM

Independent hosts needed a practical way to improve room photos, listing copy, and booking signals without making the AI output feel deceptive.

DECISION

Frame AI as believable improvement direction inside a saved host workspace, not as a generic image generator.

OUTCOME

Built the product-facing portfolio flow across marketing, auth, dashboard, and room optimization screens.

TOOLS

Next.js Supabase AI UX
Responsive UI

OWNED ARTIFACTS

Product framing Host workflow
Room optimizer UI

AI PRODUCT SYSTEMS

AI Airbnb Optimizer

Project cards should foreground the product decision before the decoration.

Product design

2026

Case study

EVIDENCE

Use proof notes for claims a reviewer should be able to inspect.

Buttons and links

Use violet for clear primary actions, dark ink for strong live links, and borders for secondary actions.

Tags

Neutral by default. Violet means active or owned. Teal means evidence or status.

WORK

The product decisions behind the interface.

The featured case studies focus on AI and product-design judgment. Each one shows the problem, constraint, decision, and evidence behind the interface.

PROTOTYPE LAB

Live experiments that prove the product instinct.

A focused playground of prototypes, creative systems, and AI-adjacent demos. Each one is here because it shows how an idea moves from rough concept to usable product surface.

3 prototypes

Built to test product feel and interaction behavior.

Playground

Prototype cards, proof notes, status chips, and experiment previews.

How I think about AI tools

Building AI tools people can question

Most AI interfaces ask people to trust an answer without showing how the system got there. That is a product problem: people cannot rely on a tool they cannot inspect.

I design for **algorithmic transparency**. When an AI makes a recommendation, people should see the reasoning, the uncertainty, and the inputs that shaped the answer. When it needs more data, it should ask instead of guessing.

The goal is not to make AI feel friendly. It is to make the system **legible**, so people know when to trust it, challenge it, or override it.

About

Editorial copy, competency cards, and dark call-to-action panel.

Mobile detail

Bottom nav, safe-area spacing, and single-column proof hierarchy.

MOTION

Quiet transitions, useful feedback.

Use short entrance fades, controlled y-translation, image scale inside clipped frames, and spring width transitions in nav labels. Respect reduced motion and avoid constant ambient movement.

Entrance

Opacity plus 18 to 26px y movement, 450ms to 550ms.

Hover

Cards lift slightly. Images scale inside clipped media frames.

Navigation

Active labels expand with spring stiffness near 350 and damping near 32.

RULES

Keep proof close to the claim.

The system works when it feels inspectable. A reviewer should see what was built, what decision mattered, and where the proof lives.

Do

- Lead with product judgment before decoration.
- Use real screenshots and project artifacts.
- Keep violet sparse and purposeful.
- Attach evidence near the claim it supports.

Do not

- Use gradient text or side-stripe callouts.
- Turn every section into the same card grid.
- Invent metrics or project outcomes.
- Use liquid-glass material as default decoration.

SOURCE RECEIPT

What this guide used.

- Root PRODUCT.md and DESIGN.md, read from the current repo.
 - src/index.css and tailwind.config.ts for colors, type scale, motion, radius, and material rules.
 - src/components/layout/Navbar.tsx, src/components/ui/evidence-note.tsx, src/components/ui/button.tsx, and case-study components.
 - Local route captures from /, /work, /playground, /about, and /project/staybooked on 127.0.0.1:8080.
 - Open Design local DESIGN.md format and install API.
